## About the Minnesota Minnesota Center for Fiscal Excellence

The Minnesota Center for Fiscal Excellence was founded in 1926 to promote sound tax policy, efficient spending, and accountable government.

We pursue this mission by

- educating and informing Minnesotans about sound fiscal policy;
- providing state and local policy makers with objective, non-partisan research about the impacts of tax and spending policies
- advocating for the adoption of policies reflecting principles of fiscal excellence.

MCFE generally defers from taking positions on levels of government taxation and spending believing that citizens, through their elected officials, are responsible for determining the level of government they are willing to support with their tax dollars. Instead, MCFE seeks to ensure that revenues raised to support government adhere to good tax policy principles and that the spending supported by these revenues accomplishes its purpose in an efficient, transparent, and accountable manner.

The Center is a non-profit, non-partisan group supported by membership dues. For information about membership, call (651) 224-7477, or visit our web site at www.fiscalexcellence.org

## I. Introduction

This is MCFE's fourteenth national property tax comparison study, which reports on relative property tax burdens across the United States. We compare effective property tax rates (that is, total tax divided by total value) for four classes of property located in the largest city of each state (plus an additional city for Illinois and New York) and the District of Columbia, the largest fifty cities in the United States, and a rural area for each state. We select cities for our rural analysis based on a rural-urban classification continuum developed by the U.S. Department of Agriculture. Cities included in the rural analysis must be county seats with populations of 2,500 to 10,000 located outside of metropolitan statistical areas. See Appendix A for more information on this methodology.

This study is most useful when used in connection with other information about state and local tax structures. Some locations have relatively high property tax levies because those local governments are more dependent on "own-source" revenue (revenue they raise themselves) or have limited non-property tax options available to them. Other states have higher income and sales taxes in part to finance a greater share of the cost of local government. Also, the property tax on a selected class of property may be relatively high or low due to state or local policies designed to redistribute property tax burdens across the classes of property through exemptions, differential assessment rates, or other classification schemes.
We continue to use fixed-value examples to facilitate comparisons with earlier studies ${ }^{1}$. Fixed values enable comparisons of the tax burden resulting from each state's tax structure, unaffected by local real estate markets. However, fixed values for homestead property are often not representative of typical home values in a particular community. Therefore, this study also compares homeowner tax burdens for the median-value home in each large (i.e. "non-rural") city.

Importantly, this year we have made a change to the methodology in our median home value analysis. Beginngin with this edition of the study we are using American Community Survey data on median home values as it provides more robust information while allowing for more precise geographical detail. Readers should make time-trend comparisons of tax burdens on medianvalued homes before and after this methodological change with care.

This study assumes that the "true market value" of each of several parcels of property is the same in all 124 locations studied. Because the "assessed value" of property varies from state to state, sometimes significantly, our tax calculations necessarily account for the effects of local assessment practices as well as statutory tax provisions. This involves the use of the "sales ratio" statistic - the comparison of actual sales prices to assessed values. Since this statistic can significantly impact year-to-year changes in property tax burdens and rankings, we encourage readers to turn to the Appendix to better understand how this statistic works, why we include it in our calculations, and what implications it can have for our results. The appendix also generally reviews the methodology used in determining the property tax liabilities of the four sample property types and the important assumptions necessary to standardize the calculations and make the numbers comparable across the states.

The report also includes estimates of the effect that relief programs which freeze or limit increases in home value and/or property taxes at the individual level have on homeowner property tax burdens. We first added this feature to the study in our payable 2012 edition.

Note that we provide two sets of industrial rankings; one where personal property equals $50 \%$ of total parcel value and one where personal property equals $60 \%$ of total parcel value. Our research indicates that, on a statewide basis, the shares of personal property for industrial properties ranges from a low of $50.7 \%$ (Oregon) to a high of $60.0 \%$ (Montana). Our Frequently Asked Questions and Methodology sections have much more on this topic.

[^0]Data for property tax calculations were collected in one of two ways. Where possible, property tax data was collected directly from various state and local websites. Where such data was not available, we calculated property taxes using a contact-verification approach in which state or local tax experts were asked to provide information and provided verification when necessary.

Based on population growth and data collection issues, our set of Rural cities has changed from the payable 2013 edition of this study as follows:

| State | Pay 2013 Rural City | Pay 2014 Rural City |
| :--- | :--- | :--- |
| IL | Clinton | Galena |
| KY | Laurel | Morehead |
| MS | Aberdeen | Philadelphia |
| VT | Newport | Hartford |
| WA | Colville | Okanogan |

This report is organized as follows:
Secton II contains a "Frequently Asked Questions" section, designed to provide interested readers with additional clarity about the contents of the report.

Section III presents urban and rural results for all classes of property by U.S. Census Bureau geographic region, with states assigned to the various regions as follows. New England: Connecticut, Massachusetts, Maine, New Hampshire, Rhode Island, and Vermont. MidAtlantic: Delaware, District of Columbia, Maryland, New Jersey, New York and Pennsylvania. South: Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, Virginia and West Virginia. Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, North Dakota, Nebraska, Ohio, South Dakota and Wisconsin. Southwest: Arizona, New Mexico, Oklahoma and Texas. West: Alaska, Colorado, California, Hawaii, Idaho, Montana, Nevada, Oregon, Utah, Washington and Wyoming. This section also provides information on the highest and lowest property tax burdens for individual cities in our largest fifty city and urban city sets. It also includes an analysis of several key features such as classification systems, disparities between homestead and non-homestead properties (particularly business property), the effects of assessment limitations, and personal property assumptions.

Sections IV, V and VI contain the complete set of comparison tables referenced in this report.
Section VII is an appendix detailing our methodology and assumptions.

## II. Frequently Asked Questions

## What's in this publication?

Our 50-State Property Tax Comparison Study calculates the net property taxes paid and the effective tax rates for homestead, commercial (retail), industrial (manufacturing), and apartment properties of various values in:

- The largest city in each of the fifty states ${ }^{2}$ and the District of Columbia, as well as Buffalo, New York and Aurora, Illinois (Urban analysis);
- The largest fifty cities in the United States ${ }^{3}$ (Top 50 analysis); and
- A rural city in each of the fifty states (Rural analysis).

The study also provides additional analysis and commentary.

## Why does the Urban analysis include two cities from Illinois and New York?

In most cases, property tax structures are uniform within states. However, this is not the case in Cook County (Chicago) and New York City, which have substantially different property tax regimes than the remainder of Illinois and New York. We include the second-largest cities in those states (Buffalo and Aurora) to represent the prevalent property tax structures in those states. In essence, our Urban analysis is a comparison of 53 different property tax structures, not 50 different states and D.C. with over-representation in two states.

## How do you select cities for the Rural analysis?

For early editions of this study, local contacts selected cities in "typical rural areas" for our Rural analysis. We began using the rural-urban continuum codes ${ }^{4}$ developed by the U.S. Department of Agriculture to guide our rural city choices for our payable 2008 study. Where possible, we limited rural city selections to county seats in counties with one of two codes:

- Code 6 (Nonmetro, urban population of 2,500-19,999, adjacent to a metro area)
- Code 7 (Nonmetro, urban population of 2,500-19,999, not adjacent to a metro area)

Six states (Connecticut, Delaware, Hawaii, Massachusetts, New Jersey, and Rhode Island) either have no usable Code 6 or Code 7 counties, or have Code 6 or Code 7 counties that are not useful for this study's purposes (for example, the Code 6 or Code 7 counties in Massachusetts comprise Nantucket and Dukes Islands).

All cities used in the Rural analysis are county seats with populations between 2,500 and 10,000 . Wherever possible, we maintain continuity in the set of rural cities from one study to the next.

This metholodogy helps ensure that cities are more homogenous with regard to population and relationship to urban areas (i.e., removing large regional centers, cities in metro areas, and cities in very lightly populated areas) and has largely eliminated subjectivity in city choice.

## So, this report compares property tax burdens between different locations. What else does it do.

The study also provides a comparison of subsidization inherent in property tax systems. The study measures homeowner subsidies paid by business property by measuring ratios of commercial-to-homestead effective tax rates and apartment-to-homestead effective tax rates.

## How do you compute the net tax on a property?

We use the following equation to calculate the net property taxes on our hypothetical properties:
Net Property Tax = ((TMV x SR) - EX) $\mathbf{x}$ CR x TR - C

[^1]True Market Value (TMV) is the value a parcel of property would fetch in an arms-length transaction between willing buyers and sellers. For some locations, the assumed true market value may not be typical (a $\$ 150,000$ home in Boston, for example). However, having constant market values from location to location allows us to observe the isolated effects of tax structures - effectively comparing property taxes, not local real estate markets.

Sales Ratio (SR) data measures the effects of assessment practices on relative tax burdens. This is a unique aspect of our study. Most simply, sales ratios measure the accuracy of assessments. The sales ratio figure is determined by comparing assessments to actual sales. Ideally, that figure will be close to $100 \%$. There are three main reasons why assessed values differ from actual sales:

- Changes in the real estate market since the assessment date change the value of the property,
- Some sort of assessment error or bias has been introduced; or,
- Assessors are by law prevented from assessing a property at its full market value.

We adjust the assumed true market values for each of the sample properties in our study based on the sales ratio data provided for each location. Since our fixed reference point for all calculations is an assumed true market value, it is important to adjust for the fact that a $\$ 150,000$ residential homestead may be "on the books" at $\$ 155,000$ in one location, and $\$ 140,000$ in another; and that the actual tax on the property will be based on these estimates of market value. Applying the sales ratio allows us to treat properties consistently, regardless of assessment differences between locations.

Certain states or localities will Exempt (EX) a certain portion of a property's value from taxation. Generally, these exemptions are for residential property, but some states or localities also provide exemptions for business properties. Since the exemption is applied to the assessed value of a property, we apply it after generating the sales-ratio-adjusted property value.

The Classification Rate (CR) indicates the portion of a property's total value subject to the property tax, based on the "class" a property is grouped into. For example, the classification rate for homes in Alabama is $10 \%$; so a home with a true market value of $\$ 150,000$ is valued at $\$ 15,000$ for tax purposes. Many states that have classification rates have different rates for different classes of properties. This is designed to affect the distribution of property tax levies, by favoring certain classes at the expense of others.

The Total Local Tax Rate is the combination of state and local tax rates for payable 2014 that apply to the largest number of properties in each of our study locations. We defined "payable 2014 property taxes" as those taxes where the lien affixes to the property in 2014, regardless of when the taxes are actually due.

Finally, we subtract Credits or Refunds (C) that are offered to the majority of homeowners. We do not include credits, refunds, or other special provisions offered to senior or disabled homeowners, because they do not make up a majority of homeowners, and so do not represent the typical experience.

Note that the study does not include special assessments, since they can be thought of as user charges, may not affect a majority of parcels, and are usually not sources of general revenue.

How do you determine the property values you use for your sample properties?
This report analyzes two different kinds of property: real property (land and buildings), and personal property (movable property). The study examines commercial and industrial properties with "low", "medium", and "high" real property values. Apartment property consists of only one value. Rural homes have "low", "medium", and "high" real property values; the "low" valuedhome is eliminated for our Urban and Top 50 analyses as being too unrealistic for most urban areas in the study.

## Do you ever vary the property values between locations?

We do compare homeowner property taxes in Urban and Top 50 cities using a "median value analysis". We do this by setting the home value for each city equal to the median value of owneroccupied housing units in each city, or for smaller cities, in the relevant county. This data comes from the one-year data in the Census Bureau's American Community Survey for 2013. This comparison provides perspective on how differences in local real estate markets affect residential property taxes.

As noted in the introduction, this methodology is a change from previous editions of the study, where our median home value data came from metropolitan-area data provided by the National Association of Realtors. American Community Survey data provides more robust information on median home values and provides greater geographic detail than the metropolitan statistical area level. Readers should make time-trend comparisons of tax burdens on median-valued homes before and after this methodological change with care.

## How do you deal with assessment limitations or other property relief programs?

This study incorporates relief programs that are broadly applicable (i.e. those not aimed at certain classes of homeowners, such as the elderly), where the value of the relief is not based on homeowner tenure or income.

Policies that limit year-to-year growth in residential property assessments or taxes through a cap or a freeze mechanism often influence tax burdens. Beginning with our payable 2012 study, we incorporated additional analyses that measure the effect of relief programs that freeze or limit increases in home value or property taxes at the individual parcel level. See our methodology section for details.

## Why don't you look at other types of property, like farms or cabins?

Ideally, this study would include every type of property. However, time and resource constraints limit us to the four types of property already discussed. It would be difficult to set true market values for farms or utility properties, given their complexities. Cabins are problematic because of their limited geographic scope. However, apartment, commercial, industrial, and residential homesteads comprise nearly $70 \%$ of total market value in Minnesota, so we believe that this report covers a wide majority of properties across the nation.

## Tell me more about "personal property" - for starters, what is it?

"Personal property" includes those things that businesses own that are not land or buildings (individuals also own personal property, but it is almost always exempt from tax). This study assumes three kinds of personal property:

- Machinery and Equipment (found in industrial/manufacturing properties only)
- Inventories (found in industrial/manufacturing properties only; commercial inventories are generally exempt); and,
- Fixtures (furniture, office equipment, et cetera; found in all types of business property)

## Why does personal property matter?

The amount of assumed personal property is important, because for states that fully exempt personal property, effective tax rates and rankings fall as that share of property value attributable to personal property rises, since a larger share of the total property is exempt from taxation.

## How do you know how much personal property a parcel has?

This study assumes that $1 / 6^{\text {th }}$ of total commercial property value is attributable to personal property. For industrial properties, the study presented two different assumptions: that personal property comprised $50 \%$ of total property value, and that personal property comprised $60 \%$ of total property value. We arrived at these assumptions after consulting with our sister NTC

## II. Frequently Asked Questions

organizations and by studying data provided by an actual company with property holdings in multiple states.

With the permission of the Minnesota Department of Revenue's Research Division, we have borrowed the methodology they use to determine shares of real and personal business property in their biennial Tax Incidence Study. Using that methodology, we have calculated state-specific real property, machinery and equipment, fixtures, and inventory shares for industrial parcels. Essentially, this analysis indicates how each state-specific industry mixes affect the property tax burden on industrial parcels of equal real property value.

This model indicated that our assumptions regarding industrial personal property are very reasonable; according to the model, the average split for industrial parcels nationwide is $44.0 \%$ land and buildings (real property) and $56.0 \%$ personal property. Overall, the shares of personal property range from $50.7 \%$ (Oregon) to $60.0 \%$ (Montana), with corresponding shares of real property value.
In previous editions of this study we measured tax burdens and rankings for industrial parcels where we allowed the shares of personal property to vary from state to state. We discontinued this analysis beginning with our payable 2011 report to focus resources on other study-related initiatives.

## What are the study's limitations?

It's important to recognize that property taxes are just one piece of the total state and local tax system. Some states have higher property tax levies because their local governments are more dependent on "own-source" revenues. Certain states place more responsibility for public service delivery with local government, which often translates into relatively higher property tax burdens. In other cases, the property tax on a selected class of property may be relatively high or low because of policies designed to redistribute property tax burdens between classes through exemptions, differential assessment rates, or other classification schemes. As a result, the study is most useful when used in connection with other information about state and local tax structures.

Making year-to-year comparisons of effective tax rates or net taxes paid is also problematic. If the study attempted to track the effective tax burden on an actual parcel over time, we would need to adjust property values annually based on changes in local real estate markets. Since we hold one piece of the property tax calculation (the value) constant over time but let another piece (the rate) vary from year to year, we prevent useful time-trend analysis of effective tax rates and net taxes paid. To illustrate this point, consider that the average tax on a $\$ 100,000$-valued urban commercial property in this study is $\$ 2,519,6.7 \%$ lower than the average tax on a $\$ 100,000$ urban commercial property in our payable 1995 study $(\$ 2,701)$. It does not make sense that the owner of a commercial property worth $\$ 100,000$ in payable 1995 paid $6.7 \%$ less in taxes on the same piece of property in 2014.

Another limitation involves income-sensitive property tax relief programs (often referred to as "circuit-breakers). Our study does not incorporate those types of relief programs; however, we are also investigating this area for possible future inclusion.

## III. Findings

## Homestead Property Tax Rankings and Burdens - Urban and Rural Cities

Table 22 on page 15 shows the payable 2014 property tax on two differently valued residential homesteads for the largest city in each state, Table 29 on page 26 shows the same for the nation's largest fifty cities, and Table 36 on page 37 shows the residential homestead taxes for three different valued properties in a rural area in each state.

Table 1 below provides a snapshot of payable 2014 homestead property tax burdens by Census region. In urban areas, residential property tax burdens are highest in New England followed closely by the Midwest. In rural areas, those burdens are highest in the Mid-Atlantic region with New England a close second. Residential burdens were lowest in the West and the South in urban and rural areas. Note that effective tax rates (ETR) rise as property value rises -indicating that the impact of many residential property tax relief programs declines as home value rises.

Table 1: Urban and Rural Homestead Property Taxes by Census Region and Property Value, Pay 2014

| Census <br> Region | Urban |  |  |  | Rural |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{\$ 1 5 0 , 0 0 0}$ | Emount | ETR | Amount | ETR | Amount | ETR | Amount |
| New England | $\$ 3,128$ | $2.085 \%$ | $\$ 6,521$ | $2.174 \%$ | $\$ 3,114$ | $2.076 \%$ | $\$ 6,261$ | $2.087 \%$ |
| Mid-Atlantic | $\$ 2,322$ | $1.548 \%$ | $\$ 4,838$ | $1.613 \%$ | $\$ 3,164$ | $2.109 \%$ | $\$ 6,485$ | $2.162 \%$ |
| South | $\$ 1,696$ | $1.131 \%$ | $\$ 3,662$ | $1.221 \%$ | $\$ 1,314$ | $0.876 \%$ | $\$ 2,845$ | $0.948 \%$ |
| Midwest | $\$ 2,969$ | $1.979 \%$ | $\$ 6,109$ | $2.036 \%$ | $\$ 2,549$ | $1.699 \%$ | $\$ 5,214$ | $1.738 \%$ |
| Southwest | $\$ 2,036$ | $1.357 \%$ | $\$ 4,158$ | $1.386 \%$ | $\$ 1,553$ | $1.036 \%$ | $\$ 3,186$ | $1.062 \%$ |
| West | $\$ 1,484$ | $0.989 \%$ | $\$ 3,100$ | $1.033 \%$ | $\$ 1,254$ | $0.836 \%$ | $\$ 2,645$ | $0.882 \%$ |
| U.S. Average | $\mathbf{\$ 2 , 2 3 5}$ | $\mathbf{1 . 4 9 0 \%}$ | $\mathbf{\$ 4 , 6 6 2}$ | $\mathbf{1 . 5 5 4 \%}$ | $\mathbf{\$ 2 , 0 1 7}$ | $\mathbf{1 . 3 4 5 \%}$ | $\mathbf{\$ 4 , 1 7 1}$ | $\mathbf{1 . 3 9 0 \%}$ |

Highest and Lowest Homestead Taxes - Urban
The urban cities with payable 2014 homestead tax rankings in the top or bottom five for both fixed-value examples are shown in Table 2. Note that this set includes 53 cities; because the cities of Chicago and New York have property tax systems that are fundamentally different than those found in the rest of their respective states we treat those cities as having distinct property tax systems. Locations with high rankings have relatively high tax rates and/or impose the tax on a relatively large amount of the homestead's market value. Locations ranking near the bottom tend to do so because of low property tax rates - many also offer sizable homestead exemptions: Honolulu offered a homestead exemption of $\$ 80,000$ of assessed value; Washington, D.C. offered a $\$ 70,200$ homestead exemption; and Boston offered a homestead exemption equal to the lesser of $\$ 140,210$ or $90 \%$ of the homestead's market value.

Table 2: Highest and Lowest Homestead Taxes Among Urban Cities for $\mathbf{\$ 1 5 0 , 0 0 0}$ - and $\mathbf{\$ 3 0 0 , 0 0 0}$-Valued
Homes, Payable 2014

| $\underset{\text { (of 53) }}{\text { Rank }}$ | \$150,000 |  | \$300,000 |  |

| 49 | Denver, CO | \$994 | Cheyenne, WY | \$2,005 |
| 50 | Birmingham, AL | \$990 | Denver, CO | \$1,988 |
| 51 | Washington, DC | \$650 | Washington, DC | \$1,897 |
| 52 | Honolulu, HI | \$242 | Boston, MA | \$1,746 |
| 53 | Boston, MA | \$175 | Honolulu, HI | \$765 |

Table 3 presents the highest and lowest homestead taxes for the median-valued home in the largest city in each state and the District of Columbia. Bridgeport, Aurora and Newark continue
to impose top five burdens but Detroit and Milwaukee are replaced by higher-valued Portland, OR and Burlington, VT. However, there is far more turnover in the list of cities with the lowesttaxed homes. When measured against median values the homestead exemptions in New York City, Honolulu, Boston, and Washington (D.C.) become relatively less generous and none of those cities appear in the lowest-taxes list. Instead, they are replaced by cities where relatively low values are combined with moderate tax rates.
Table 3: Highest and Lowest Homestead Taxes Among Urban Cities for Median-Valued Homes, Pay 2014

| Rank <br> (of 53) | Median-Valued Home |  |  |  |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  | City, State | Tax | Value | ETR |
| 1 | Portland, OR | $\$ 6,774$ | $\$ 291,400$ | $2.324 \%$ |
| 2 | Bridgeport, CT | $\$ 6,601$ | $\$ 163,400$ | $4.040 \%$ |
| 3 | Burlington, VT | $\$ 6,415$ | $\$ 273,900$ | $2.342 \%$ |
| 4 | Newark, NJ | $\$ 5,968$ | $\$ 206,200$ | $2.894 \%$ |
| 5 | Aurora, IL | $\$ 5,576$ | $\$ 159,300$ | $3.500 \%$ |
| 49 | Jackson, MS | $\$ 1,202$ | $\$ 84,000$ | $1.431 \%$ |
| 50 | Columbia, SC | $\$ 1,182$ | $\$ 163,600$ | $0.723 \%$ |
| 51 | Indianapolis, IN | $\$ 1,171$ | $\$ 116,400$ | $1.006 \%$ |
| 52 | Charleston, WV | $\$ 803$ | $\$ 107,000$ | $0.750 \%$ |
| 53 | Birmingham, AL | $\$ 529$ | $\$ 83,800$ | $0.632 \%$ |

## Highest and Lowest Homestead Taxes - Largest 50 Cities

In the set of largest (top 50) U.S. cities, those shown in Table 4 had the highest and lowest payable 2014 property taxes for the $\$ 150,000$-valued and $\$ 300,000$-valued homesteads. There are a few changes from the previous year - most notably, Philadephia has moved out of the top 5 (into the mid-20s), reflecting the effects of changes in the city's property tax system. Two Texas locations (San Antonio and El Paso) are now in the top 5, indicating the relatively heavy reliance governments in Texas have on the property tax. Both Colorado locations benefit from the tax and expenditure limitations imposed in that state, which manifest themselves in the assessment ratio for homesteads and the property tax rate.

Table 4: Highest and Lowest Homestead Taxes Among the 50 Largest U.S. Cities for $\mathbf{\$ 1 5 0 , 0 0 0}$ and $\$ 300,000$ Valued Homes, Payable 2014

| Rank <br> (of 50) | $\$ \mathbf{c 1 5 0 , 0 0 0}$ |  | C300,000 |  |
| :---: | :--- | :---: | :--- | :---: |
|  | City, State | Tax | City, State | Tax |
| 1 | Detroit, MI | $\$ 5,964$ | Detroit, MI | $\$ 11,929$ |
| 2 | Milwaukee, WI | $\$ 4,193$ | Milwaukee, WI | $\$ 8,599$ |
| 3 | Cleveland, OH | $\$ 3,993$ | San Antonio, TX | $\$ 8,145$ |
| 4 | San Antonio, TX | $\$ 3,968$ | Cleveland, OH | $\$ 7,987$ |
| 5 | El Paso, TX | $\$ 3,859$ | El Paso, TX | $\$ 7,960$ |
| 46 | Mesa, AZ | $\$ 1,298$ | New York, NY | $\$ 1,989$ |
| 47 | Denver, CO | $\$ 994$ | Denver, CO | $\$ 1,988$ |
| 48 | Colorado Springs, CO | $\$ 716$ | Washington, DC | $\$ 1,897$ |
| 49 | Washington, DC | $\$ 650$ | Boston, MA | $\$ 1,746$ |
| 50 | Boston, MA | $\$ 175$ | Colorado Springs, CO | $\$ 1,432$ |

## Effects of Provisions that Limit Growth in Parcel-Level Assessments on Urban and Top 50 Homestead Rankings and Burdens

This report also analyzes the impact of programs that freeze or limit increases in individual parcels' assessed value. Broadly, the methodology involves measuring the average change in home values over the period of an average homeowner's tenure in relevant locales, and estimating the amount of value the provisions exclude from taxation. For more information, see the Methodology section or the working paper prepared for the Lincoln Institute of Land Policy
on the subject, available at: https://www.lincolninst.edu/pubs/2033_Property-Assessment-Limits--Effects-on-Homestead-Property-Tax-Burdens-and-National-Property-Tax-Rankings- .

Our assessment limitation-affected burdens and ranks are for urban cities shown on Table 22 and Table 24, beginning on page 15 and for the fifty largest U.S. cities on Table 29 and Table 31, starting on page 26 . Given the availability of data on local market home value changes, we are not able to perform this analysis for rural cities.

Rebounding local housing markets in the wake of Great Recession continue to create additional amounts of excluded homestead value. Our modeling indicates assessment limitations would affect homeowners with average ownership tenure in nine cities in our Urban set and seventeen cities of the nation's largest fifty. Table 5 shows how assessment limitations affect homeowners in the Urban cities. In six of these locations - Phoenix, Los Angeles, Detroit, Jacksonville, New York City and Portland - annual assessment limits generally range from $2 \%$ to $10 \%$ although some locations also have limits on multi-year increases. In the three other locations - Little Rock, Chicago, and Columbia - assessment limits are combined with periodic (as opposed to annual) revaluations in such a way that, in times when home values decline over the long-term, these provisions actually yield higher taxable values than would otherwise be the case.

Table 5: Effects of Assessment Limitations, $\mathbf{\$ 1 5 0 , 0 0 0 -}$ and $\mathbf{\$ 3 0 0 , 0 0 0 - V a l u e d ~ H o m e s , ~ U r b a n ~ C i t i e s ~}$

| City, State | Pay 2014 -- \$150,000 Home |  | Pay 2014 -- \$300,000 Home |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Change in <br> Rank | Change in <br> Tax Burden | Change <br> in Rank | Change in <br> Tax Burden |
| Phoenix, AZ | -1 | $-\$ 178$ | -- | $-\$ 355$ |
| Little Rock, AR | +1 | $-\$ 41$ | -- | $-\$ 81$ |
| Los Angeles, CA | -13 | $-\$ 668$ | -12 | $-\$ 1336$ |
| Jacksonville, FL | -2 | $-\$ 114$ | -2 | $-\$ 228$ |
| Chicago, IL | -- | $+\$ 15$ | -- | $+\$ 29$ |
| Detroit, MI | -- | $-\$ 747$ | -- | $-\$ 1,493$ |
| New York, NY | -12 | $-\$ 623$ | -9 | $--\$ 1,245$ |
| Portland, OR | -2 | $-\$ 423$ | -1 | $-\$ 846$ |
| Columbia, SC | +3 | $+\$ 90$ | +3 | $+\$ 179$ |

Table 6 shows how assessment limitations affect homeowners in the nation's fifty largest cities. As with Table 5, there are substantially more cities where assessment limitation provision effect the tax burden for a homeowner with an average ownership tenure.

Table 6: Effects of Assessment Limitations, $\mathbf{\$ 1 5 0 , 0 0 0 -}$ and $\$ 300,000-V a l u e d$ Homes, 50 Largest U.S. Cities

| City, State | Pay 2014 -- \$150,000 Home |  | Pay 2014 -- \$300,000 Home |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Change in <br> Rank | Change in <br> Tax Burden | Change in <br> Rank | Change in <br> Tax Burden |
| Mesa, AZ | +4 | $-\$ 141$ | +4 | $-\$ 281$ |
| Phoenix, AZ | +2 | $-\$ 177$ | +3 | $-\$ 356$ |
| Fresno, CA | -3 | $-\$ 291$ | -3 | $-\$ 581$ |
| Long Beach, CA | -4 | $-\$ 532$ | -5 | $-\$ 1,065$ |
| Los Angeles, CA | -11 | $-\$ 668$ | -11 | $-\$ 1,337$ |
| Oakland, CA | -11 | $-\$ 461$ | -9 | $-\$ 921$ |
| Sacramento, CA | -1 | $-\$ 368$ | -2 | $-\$ 738$ |
| San Diego, CA | -4 | $-\$ 306$ | -4 | $-\$ 611$ |
| San Francisco, CA | -8 | $-\$ 610$ | -10 | $-\$ 1,220$ |
| San Jose, CA | -8 | $-\$ 387$ | -8 | $-\$ 775$ |
| Chicago, IL | NC | $+\$ 15$ | NC | $+\$ 30$ |
| Jacksonville, FL | -1 | $-\$ 114$ | -1 | $-\$ 228$ |
| Miami, FL | -13 | $-\$ 433$ | -5 | $-\$ 866$ |
| Detroit, MI | NC | $-\$ 746$ | NC | $-\$ 1,494$ |
| New York, NY | -4 | $-\$ 622$ | -5 | $-\$ 1,245$ |
| Portland, OR | -3 | $-\$ 423$ | -3 | $-\$ 845$ |
| Austin, TX | +1 | $-\$ 26$ | +1 | $-\$ 52$ |

Such provisions provided relief equal to a low of $1 \%$ of the tax on a fully-valued home in Austin, Texas to $38 \%-41 \%$ of the tax on a fully-valued home (depeding on value) in New York City. When all assessment limitations are factored in, some cities that have reductions may move up in ranking - such as Mesa and Phoenix, Arizona - if other cities have larger reductions.

## Commercial Property Tax Rankings and Burdens - Urban and Rural Cities

Table 25 on page 18 shows the payable 2014 property tax for three commercial properties (assumed to be office buildings of selected value) in urban areas consisting of $\$ 100,000$ of real property value with $\$ 20,000$ of personal property; $\$ 1$ million of real property with $\$ 200,000$ of personal property; and $\$ 25$ million of real property with $\$ 5$ million of personal property. Table 32 on page 30 shows the same for the nation's largest fifty cities and Table 37 on page 39 shows the property taxes for commercial properties in a rural area in each state.

Table 7 below provides a snapshot of payable 2014 urban commercial property tax burdens by Census region. On average, these burdens are highest in the Midwest with New England in second place; the lowest burdens by far are found in the West. In most cases ETRs rise as property value rises - this is because exemptions are generally fixed at a certain amount and so their effects commonly diminishes as total parcel value increases.

Table 7: Urban Commercial Property Taxes by Census Region and Real Property Value, Pay 2014

|  | \$100,000 |  | \$1,000,000 |  | \$25,000,000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Amount | ETR | Amount | ETR | Amount | ETR |
| New England | \$3,258 | 2.715\% | \$32,580 | 2.715\% | \$814,508 | 2.715\% |
| Mid-Atlantic | \$2,584 | 2.153\% | \$27,151 | 2.263\% | \$714,717 | 2.382\% |
| South | \$2,217 | 1.847\% | \$22,435 | 1.870\% | \$561,798 | 1.873\% |
| Midwest | \$3,269 | 2.724\% | \$34,026 | 2.835\% | \$855,238 | 2.851\% |
| Southwest | \$2,230 | 1.858\% | \$22,750 | 1.896\% | \$594,790 | 1.983\% |
| West | \$1,621 | 1.351\% | \$16,702 | 1.392\% | \$424,143 | 1.414\% |
| U.S. Average | \$2,519 | 2.099\% | \$25,883 | 2.157\% | \$656,499 | 2.188\% |

Table 8 below provides the same information for rural municipalities. On average, these burdens are substantially higher in the Midwest than in any other region, with ETRs around $2.7 \%-2.8 \%$. The lowest burdens are found in the West where the ETR ranges between $1.3 \%$ and $1.4 \%$, depending on value. As with urban areas, ETRs rise with property value because of the diminishing effect of property tax exemptions.

Table 8: Rural Commercial Property Taxes by Census Region and Real Property Value, Pay 2014

|  | $\$ \mathbf{\$ 1 0 0 , 0 0 0}$ |  | $\mathbf{\$ 1 , 0 0 0 , 0 0 0}$ |  | $\$ \mathbf{\$ 2 5 , 0 0 0 , 0 0 0}$ |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |

| U.S. Average | $\mathbf{\$ 2 , 0 4 0}$ | $\mathbf{1 . 7 0 0 \%}$ | $\mathbf{\$ 2 0 , 9 4 5}$ | $\mathbf{1 . 7 4 5} \%$ | $\mathbf{\$ 5 2 8 , 1 6 2}$ | $\mathbf{1 . 7 6 1 \%}$ |

## Highest and Lowest Commercial Taxes - Urban

The urban cities with the highest and lowest commercial tax rankings are shown in Table 9. Locations with high rankings have relatively high tax rates and/or impose the tax on a relatively large amount of the commercial parcel's market value. Locations ranking near the bottom tend to do so because of low property tax rates and/or fractional assessment ratios - for instance in Nevada property is assessed at $35 \%$ of value and in Honolulu the tax rate on commercial real property is 12.4 mills. In Honolulu, business personal property is exempt from taxation, providing an additional competitive edge. Of particular interest is the steep drop in

Philadelphia's ranking - which moved out of Top 5 status at all values as a result of changes in the city's property tax system.

Table 9: Urban Cities with Highest and Lowest Commercial Property Taxes, Payable 2014

| Rank (of 53) | \$100,000 |  | \$1,000,000 |  | \$25,000,000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 53 | Cheyenne, WY | \$831 | Cheyenne, WY | \$8,309 | Cheyenne, WY | \$207,719 |

Highest and Lowest Commercial Taxes - Largest 50 Cities
The locations with the highest and lowest commercial property taxes in the nation's fifty largest cities are listed below in Table 10. Cities rank highly because of high property tax rates and/or relatively high assessment ratios; cities generally rank near the bottom because of low assessment ratios and/or relatively low property tax rates. The large decline in Philadelphia's rankings documented in the Urban set of cities can be seen here as well.

Table 10: Highest and Lowest Commercial Property Taxes Among the 50 Largest U.S. Cities, Payable 2014

| Rank (of 50) | \$100,000 |  | \$1,000,000 |  | \$25,000,000 |  |

| 50 | Seattle, WA | \$1,140 | Seattle, WA | \$11,397 | Seattle, WA | \$284,925 |

## Industrial Property Tax Rankings and Burdens - Urban and Rural Cities

We consider industrial (manufacturing) property separately from commercial property because they tend to have higher proportions of personal property - an important consideration since states vary significantly in their tax treatment of personal property. We use the same set of real value assumptions as for commercial property ( $\$ 100,000, \$ 1$ million, and $\$ 25$ million). We calculate and rank tax burdens for two different personal property assumptions: where personal property comprises $50 \%$ of the total parcel value; and where personal property comprises $60 \%$ of the total parcel value. Table 11 on the next page provides a thumbnail sketch of the two assumptions.

Table 11: Industrial Parcel Value Assumptions

| Pers. Property <br> As Share of Total <br> Parcel Value | Real |  <br> Equip. | Inventories | Fixtures | Total |
| :---: | ---: | ---: | ---: | ---: | ---: |
|  | $\$ 100,000$ | $\$ 50,000$ | $\$ 40,000$ | $\$ 10,000$ | $\mathbf{\$ 2 0 0 , 0 0 0}$ |
| $(50 \%$ of Total $)$ | $\$ 1,000,000$ | $\$ 500,000$ | $\$ 400,000$ | $\$ 100,000$ | $\mathbf{\$ 2 , 0 0 0 , 0 0 0}$ |
|  | $\$ 25,000,000$ | $\$ 12,500,000$ | $\$ 10,000,000$ | $\$ 2,500,00$ | $\mathbf{\$ 5 0 , 0 0 0 , 0 0 0}$ |
|  | $\$ 100,000$ | $\$ 75,000$ | $\$ 60,000$ | $\$ 15,000$ | $\mathbf{\$ 2 5 0 , 0 0 0}$ |
| $(60 \%$ of Total) | $\$ 1,000,000$ | $\$ 750,000$ | $\$ 600,000$ | $\$ 150,000$ | $\mathbf{\$ 2 , 5 0 0 , 0 0 0}$ |
|  | $\$ 25,000,000$ | $\$ 18,750,000$ | $\$ 15,000,000$ | $\$ 3,750,000$ | $\mathbf{\$ 6 2 , 5 0 0 , 0 0 0}$ |

Our payable 2014 industrial tax burden findings can be found in the following sections of the report beginning with Table 26 on page 21 for urban cities; beginning with Table 33 on page 32 for the nation's largest fifty cities and Table 38 on page 41 for rural municipalities.

Table 12 below provides a snapshot of payable 2014 urban industrial property tax burdens by Census region where $50 \%$ of the total parcel value is assumed to be personal property. On average, these burdens are highest in the South and the Midwest at the $\$ 100,000$ level and by the Southwest for the two higher valued parcels followed closely by the South and Midwest. The lowest tax burdens - by far - are found in the West. Compared to commercial properties of equal values, industrial properties generally have higher total taxes but lower effective tax rates. Usually, this is because industrial properties have more personal property than commercial parcels - which provides a bigger tax base - but a significant portion of that bigger tax base (the personal property) is oftentimes either not taxed or is taxed at lower rates than real property. As is the case with commercial properties, ETRs tend to rise as values rise - largely representing the diminishing effect of property tax exemptions as parcel values rise.

Table 12: Urban Industrial Property Taxes by Census Region and Real Property Value, Pay 2014

|  | $\$ 100,000$ |  | $\$ \mathbf{1 , 0 0 0 , 0 0 0}$ |  | $\$ \mathbf{~ 2 5 , 0 0 0 , 0 0 0}$ |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Amount | ETR | Amount | ETR | Amount | ETR |
| New England | $\$ 3,090$ | $1.545 \%$ | $\$ 30,899$ | $1.545 \%$ | $\$ 772,481$ | $1.545 \%$ |
| Mid-Atlantic | $\$ 2,504$ | $1.252 \%$ | $\$ 28,173$ | $1.409 \%$ | $\$ 743,318$ | $1.487 \%$ |
| South | $\$ 3,480$ | $1.740 \%$ | $\$ 35,149$ | $1.757 \%$ | $\$ 879,633$ | $1.759 \%$ |
| Midwest | $\$ 3,408$ | $1.704 \%$ | $\$ 36,598$ | $1.830 \%$ | $\$ 919,558$ | $1.839 \%$ |
| Southwest | $\$ 3,244$ | $1.622 \%$ | $\$ 35,958$ | $1.798 \%$ | $\$ 925,011$ | $1.850 \%$ |
| West | $\$ 2,139$ | $1.070 \%$ | $\$ 22,492$ | $1.125 \%$ | $\$ 569,304$ | $1.139 \%$ |
| U.S. Average | $\mathbf{\$ 2 , 9 9 3}$ | $\mathbf{1 . 4 9 7 \%}$ | $\mathbf{\$ 3 1 , 5 3 6}$ | $\mathbf{1 . 5 7 7 \%}$ | $\mathbf{\$ 7 9 8 , 3 0 9}$ | $\mathbf{1 . 5 9 7 \%}$ |

Note: assumes $50 \%$ of total parcel value is personal property and $50 \%$ is real property.
Table 13 provides the same information for rural municipalities. Without doubt these burdens are highest on average in the Midwest with ETRs of roughly $1.5 \%-1.6 \%$; the lowest burdens are found in the West where the ETR ranges from $0.85 \%$ to $0.98 \%$, depending on parcel value. The comments above regarding the relationship between the tax burdens on urban commercial and industrial properties and the increase in effective tax rates as urban values rise also apply here.

Table 13: Rural Industrial Property Taxes by Census Region and Real Property Value, Pay 2014

|  | \$100,000 |  | \$1,000,000 |  | \$25,000,000 |  |

| West | \$1,757 | 0.879\% | \$19,129 | 0.956\% | \$503,035 | 1.006\% |
| U.S. Average | \$2,436 | 1.218\% | \$25,543 | 1.277\% | \$647,029 | 1.294\% |

Note: assumes $50 \%$ of total parcel value is personal property and $50 \%$ is real property.

## Highest and Lowest Industrial Taxes - Urban

The urban cities with payable 2014 industrial tax rankings in the top or bottom five where personal property comprises $50 \%$ of the parcel's value are shown in Table 14 on the next page. Locations with high rankings have relatively high tax rates and/or impose the tax on a relatively large amount of the commercial parcel's market value. For instance, by law South Carolina assesses industrial land and buildings at $10.5 \%$ of market value, compared to $4 \%$ for homesteads and $6 \%$ for commercial property. Locations ranking near the bottom tend to do so because of low property tax rates, assessment at some fraction of market value (Wilmington's sales ratio is $30.4 \%$ for industrial properties, for example), an exemption for business property (Fargo, Wilmington and Honolulu), or some combination of the three.

Table 14: Urban Cities with the Highest and Lowest Industrial Taxes, Payable 2014

| Rank <br> (of 53) | \$100,000 |  | \$1,000,000 |  | \$25,000,000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | City, State | Tax | City, State | Tax | City, State | Tax |
| 1 | Columbia, SC | \$7,973 | Columbia, SC | \$79,434 | Columbia, SC | \$1,985,861 |
| 2 | Memphis, TN | \$5,439 | Detroit, MI | \$62,413 | Detroit, MI | \$1,560,321 |
| 3 | Jackson, MS | \$5,364 | Memphis, TN | \$54,390 | Memphis, TN | \$1,359,750 |
| 4 | Houston, TX | \$5,141 | Jackson, MS | \$53,640 | Jackson, MS | \$1,341,000 |
| 5 | Indianapolis, IN | \$4,814 | Houston, TX | \$51,413 | Houston, TX | \$1,285,325 |
| 49 | Cheyenne, WY | \$1,337 | Fargo, ND | \$13,974 | Fargo, ND | \$349,338 |
| 50 | Philadelphia, PA | \$1,327 | Cheyenne, WY | \$13,375 | Cheyenne, WY | \$334,374 |
| 51 | Wilmington, DE | \$1,320 | Wilmington, DE | \$13,199 | Wilmington, DE | \$329,984 |
| 52 | Honolulu, HI | \$1,194 | Honolulu, HI | \$11,937 | Honolulu, HI | \$298,437 |
| 53 | Virginia Beach, VA | \$1,025 | Virginia Beach, VA | \$10,246 | Virginia Beach, VA | \$256,155 |

Note: assumes $50 \%$ of total parcel value is personal property and $50 \%$ is real property.

## Highest and Lowest Industrial Taxes - Largest 50 Cities

The locations with the highest and lowest industrial property taxes in the nation's fifty largest cities are listed on the next page in Table 15. Similar to the urban city results, Detroit has moved out of the top rank for the $\$ 100,000$-valued property. Three or four (depending on value) of the five highest ranked locations (and six to seven of the top ten) are located in Texas - reflecting in part Texas' relatively high reliance on the property tax in its state and local finances and in part its policy of taxing all types of business personal property. Cities rank highly because of high property tax rates and/or relatively high assessment ratios; cities generally rank near the bottom because of low assessment ratios, relatively low property tax rates, and/or business personal property exemptions.

Table 15: Highest and Lowest Industrial Property Taxes Among the 50 Largest U.S. Cities, Payable 2014

| $\begin{gathered} \text { Rank } \\ \text { (of 50) } \end{gathered}$ | \$100,000 |  | \$1,000,000 |  | \$25,000,000 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | City, State | Tax | City, State | Tax | City, State | Tax |
| 1 | Fort Worth, TX | \$5,637 | Detroit, MI | \$62,413 | Detroit, MI | \$1,560,321 |
| 2 | Dallas, TX | \$5,486 | Fort Worth, TX | \$56,368 | Fort Worth, TX | \$1,409,199 |
| 3 | El Paso, TX | \$5,473 | Dallas, TX | \$54,859 | Dallas, TX | \$1,371,480 |
| 4 | Memphis, TN | \$5,439 | El Paso, TX | \$54,726 | El Paso, TX | \$1,368,141 |
| 5 | San Antonio, TX | \$5,411 | Memphis, TN | \$53,390 | Memphis, TN | \$1,359,750 |
| 46 | Washington, DC | \$1,577 | Las Vegas, NV | \$18,063 | Las Vegas, NV | \$451,572 |

| 48 | Seattle, WA | \$1,548 | Louisville, KY | \$15,725 | Louisville, KY | \$393,137 |
| 49 | Philadelphia, PA | \$1,327 | Seattle, WA | \$15,481 | Seattle, WA | \$387,019 |
| 50 | Virginia Beach, VA | \$1,025 | Virginia Beach, VA | \$10,246 | Virginia Beach, VA | \$256,155 |

Note: assumes $50 \%$ of total parcel value is personal property and $50 \%$ is real property.

## III. Findings

## Apartment Property Tax Rankings and Burdens - Urban and Rural Cities

We calculate property taxes on a $\$ 600,000$ unfurnished apartment building with $\$ 30,000$ of personal property. Complete findings are available for urban properties (Table 28 on page 25), top 50 cities (Table 35 on page 36), and rural municipalities (Table 40 on page 45). Table 16 shows payable 2014 apartment property tax burdens by Census region for both urban and rural cities. On average, tax burdens in both urban and rural areas are highest in the Midwest region with New England and the Mid-Atlantic very close behind; and lowest by far in the West; although in rural areas burdens in the South and Southwest are much closer to the low burdens found in the West.

Table 16: Urban and Rural Apartment Property Taxes by Census Region, Payable 2014

|  | Urban |  | Rural |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Amount | ETR | Amount | ETR |
| New England | $\$ 15,107$ | $2.398 \%$ | $\$ 12,684$ | $2.013 \%$ |
| Mid-Atlantic | $\$ 14,974$ | $2.377 \%$ | $\$ 13,253$ | $2.104 \%$ |
| South | $\$ 11,212$ | $1.780 \%$ | $\$ 8,436$ | $1.339 \%$ |
| Midwest | $\$ 15,568$ | $2.471 \%$ | $\$ 13,305$ | $2.112 \%$ |
| Southwest | $\$ 9,746$ | $1.547 \%$ | $\$ 7,902$ | $1.254 \%$ |
| West | $\$ 6,890$ | $1.094 \%$ | $\$ 6,019$ | $0.960 \%$ |
| U.S. Average | $\mathbf{\$ 1 2 , 2 1 1}$ | $\mathbf{1 . 9 3 8 \%}$ | $\mathbf{\$ 1 0 , 0 2 8}$ | $\mathbf{1 . 5 9 2 \%}$ |

Note: assumes $\$ 600,000$-valued property with $\$ 30,000$ in personal property.

## Highest and Lowest Apartment Taxes - Urban

The urban cities with the highest and lowest apartment property taxes were:
Table 17: Urban Cities with the Highest and Lowest Apartment Taxes, Payable 2014

| City, State | $\$ \mathbf{\$ 0 0 , 0 0 0}$ |  |
| :--- | :---: | :---: |
|  | Tax | Rank <br> (of 53) |
| New York, NY | $\$ 34,335$ | 1 |
| Detroit, MI | $\$ 31,481$ | 2 |
| Des Moines, IA | $\$ 26,562$ | 3 |
| Aurora, IL | $\$ 23,584$ | 4 |
| Bridgeport, CT | $\$ 21,929$ | 5 |
| Salt Lake City, UT | $\$ 5,528$ | 49 |
| Washington, DC | $\$ 4,876$ | 50 |
| Denver, CO | $\$ 4,656$ | 51 |
| Cheyenne, WY | $\$ 3,967$ | 52 |
| Honolulu, HI | $\$ 2,051$ | 53 |

Locations with high rankings have relatively high tax rates and/or impose the tax on a relatively large amount of the commercial parcel's market value. Locations ranking near the bottom tend to do so because of low property tax rates, assessment ratios at some fraction of market value, substantial exemptions of value, or some combination of the three.

## Highest and Lowest Apartment Taxes - Largest 50 Cities

The locations with the highest and lowest apartment property taxes in the nation's fifty largest cities are listed below in Table 18. Note that the two most highly ranked cities (Detroit and New York City) have apartment property taxes that are significantly higher than the third-ranked city (Memphis). Conversely, the city with the bottom ranking (Colorado Springs) has a burden that is substantially below the next-highest ranked city (Denver). Four of the top ten ranked locations (\#6 through \#9) are in Texas while the two lowest-ranked locations are situated in Colorado. As before, cities rank highly because of high property tax rates and/or relatively high assessment ratios; cities generally rank near the bottom because of low assessment ratios and/or relatively low property tax rates.

Table 18: Highest and Lowest Apartment Property Taxes Among the 50 Largest U.S. Cities, Payable 2014

| City, State | $\$ \mathbf{6 0 0 , 0 0 0}$ |  |
| :--- | :---: | :---: |
|  | Tax | Rank <br> (of 50) |
| New York, NY | $\$ 34,335$ | 1 |
| Detroit, MI | $\$ 31,481$ | 2 |
| Memphis, TN | $\$ 19,347$ | 3 |
| Cleveland, OH | $\$ 19,231$ | 4 |
| Milwaukee, WI | $\$ 18,427$ | 5 |
| Mesa, AZ | $\$ 6,077$ | 46 |
| Seattle, WA | $\$ 5,919$ | 47 |
| Washington, DC | $\$ 4,876$ | 48 |
| Denver, CO | $\$ 4,656$ | 49 |
| Colorado Springs, CO | $\$ 3,309$ | 50 |

## III. Findings

Findings - Subsidization of Homeowners and Relationship to Property Tax Growth
Table 19 shows the ratio of the effective tax rate on a $\$ 1$ million commercial property to the effective tax rate on a median-value homestead property for each metropolitan area (real property only). This "classification ratio" provides a summary measure of the degree to which homeowner property taxes are subsized by commercial property owners.

A ratio of 1.0 indicates that no classification is apparent (at least as it relates to the relationship between these two property types, which are typically the target of most classification systems). A ratio greater than 1.0 indicates some degree of classification, broadly defined, with higher values reflecting a greater degree of classification. ${ }^{5}$

Table 19: Commercial-Homestead Classification Ratios for Payable 2014, Urban Cities

| State | City | Median <br> Value (\$) | Ratio |  | State | City | Median <br> Value (\$) |  | Rank |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| New York | New York City | 488,100 | 4.323 | 1 | South Dakota | Sioux Falls | 153,300 | 1.341 | 27 |
| Massachusetts | Boston | 381,700 | 4.009 | 2 | Texas | Houston | 125,700 | 1.330 | 28 |
| Hawaii | Honolulu | 550,400 | 3.663 | 3 | Arkansas | Little Rock | 159,900 | 1.262 | 29 |
| South Carolina | Columbia | 163,600 | 3.661 | 4 | Georgia | Atlanta | 200,900 | 1.256 | 30 |
| Colorado | Denver | 263,900 | 3.618 | 5 | North Dakota | Fargo | 164,200 | 1.203 | 31 |

| Idaho | Boise | 169,000 | 2.093 | 14 | Wyoming | Cheyenne | 197,800 | 1.036 | 40 |
| West Virginia | Charleston | 107,000 | 2.071 | 15 | California | Los Angeles | 451,200 | 1.016 | 41 |
| District of Columbia | Washington | 470,500 | 2.028 | 16 | Kentucky | Louisville | 141,900 | 1.014 | 42 |
| Iowa | Des Moines | 113,900 | 1.962 | 17 | Nebraska | Omaha | 134,600 | 1.000 | 43 |
| Rhode Island | Providence | 170,800 | 1.909 | 18 | New Hampshire | Manchester | 206,600 | 1.000 | 43 |
| Mississippi | Jackson | 84,000 | 1.874 | 19 | New Jersey | Newark | 206,200 | 1.000 | 43 |
| Missouri | Kansas City | 126,900 | 1.831 | 20 | North Carolina | Charlotte | 165,900 | 1.000 | 43 |
| New York | Buffalo | 68,500 | 1.791 | 21 | Oregon | Portland | 291,400 | 1.000 | 43 |
| Utah | Salt Lake City | 249,600 | 1.788 | 22 | Washington | Seattle | 436,600 | 1.000 | 43 |
| U.S. Average |  |  | 1.710 | -- | Nevada | Las Vegas | 162,400 | 0.988 | 49 |
| U.S. Average (w/o NYC) |  |  | 1.659 | -- | Delaware | Wilmington | 152,100 | 0.981 | 50 |
| Tennessee | Memphis | 89,400 | 1.600 | 23 | Virginia | Virginia Beach | 259,200 | 0.953 | 51 |
| Montana | Billings | 186,600 | 1.481 | 24 | Connecticut | Bridgeport | 163,400 | 0.868 | 52 |
| Florida | Jacksonville | 129,700 | 1.452 | 25 | Maryland | Baltimore | 150,000 | 0.862 | 53 |
| Ohio | Columbus | 123,700 | 1.365 | 26 |  |  |  |  |  |
| Ratio = \$1 million commercial ETR (real property only) divided by median value home ETR. |  |  |  |  |  |  |  |  |  |

The ratios were calculated for real property only, after adjusting for differences in assessment practices. Differences in the quality of assessments among various classes of property can produce a de facto classification system even in the absence of statutory classification schemes.

[^2]Locations that rank near the top of this list do so because of extreme differences in classification ratios between these two types of property. For instance, in New York City, residential property is assessed at $6 \%$ of value while commercial property is assessed at $45 \%$ of value. In other cases differences in tax rates and/or homestead exemptions or credits account for the differences, such as in Boston; where nearly $37 \%$ of the value of the median home is exempt from taxation and the homestead tax rate is some $40 \%$ that of commercial and industrial properties.

On a national basis, tax disparities between commercial and homestead properties fell slightly to 1.710 - meaning that the effective tax rate on $\$ 1$ million commercial properties nationwide is, on average, $71.0 \%$ higher than the effective tax rate on median-valued homes. As Figure 1 below indicates, this 1.710 figure represents a fairly average classification ratio since 1998. Tax disparities for "classified" locations ${ }^{6}$, where residential and commercial property are treated differently in statute, also fell, to 1.923 - substantially lower then the 2.045 recorded for payable 2012 and about $2.5 \%$ lower than the long-term average of 1.969 . The decrease in the classification ratio $-0.3 \%$ for all locations and $1.2 \%$ in the subset of "classified" locations, indicates that states (and where allowed, local governments) are either providing fewer subsidies to homeowners or that the subsidies they provide are worth less on average than they were in payable 2013.

Figure 1: Commercial-Homestead Classification Ratio, Urban Cities, 1998-2014

[^3]
## III. Findings

Similar analysis can be performed for other property types. Table 20 shows the classification ratio for apartments versus homes, which provides another use finding - the degree of subsidy provided to homeowners at the expense of renters.

Table 20: Ratio of Apartment Effective Tax Rates (ETRs) to Homestead Rates, Urban Cities, Pay 2014

| State | City | Median Value (\$) |  |  | State | City | $\begin{aligned} & \text { Median F } \\ & \text { Value (\$) } \end{aligned}$ |  | Rank |

| South Dakota | Sioux Falls | 153,300 | 1.341 | 17 | New Jersey | Newark | 206,200 | 1.000 | 40 |
| U.S. Avg (w/o NYC) |  |  | 1.312 | -- | North Carolina | Charlotte | 165,900 | 1.000 | 40 |
| Texas | Houston | 125,700 | 1.285 | 18 | Oregon | Portland | 291,400 | 1.000 | 40 |
| Pennsylvania | Philadelphia | 136,800 | 1.281 | 19 | Washington | Seattle | 436,600 | 1.000 | 40 |
| Michigan | Detroit | 36,800 | 1.266 | 20 | Colorado | Denver | 263,900 | 0.989 | 48 |
| Arkansas | Little Rock | 159,900 | 1.262 | 21 | Nevada | Las Vegas | 162,400 | 0.988 | 49 |
| Georgia | Atlanta | 200,900 | 1.256 | 22 | Utah | Salt Lake City | 249,600 | 0.984 | 50 |
| North Dakota | Fargo | 164,200 | 1.203 | 23 | Wyoming | Cheyenne | 197,800 | 0.937 | 51 |
| District of Columbia | Washington | 470,500 | 1.153 | 24 | Connecticut | Bridgeport | 163,400 | 0.868 | 52 |
| Hawaii | Honolulu | 550,400 | 1.150 | 25 | Maryland | Baltimore | 150,000 | 0.862 | 53 |
| Arizona | Phoenix | 162,300 | 1.128 | 26 |  |  |  |  |  |

Overall, the U.S. average ratio fell $0.1 \%$ from the previous year; and by $0.2 \%$ if New York City is excluded, largely a reflection that effective tax rates for the average-valued median home increased just slightly faster than effective tax rates for apartment properties. This indicates that homeowners are being offered a lower relative level of subsidy, either because existing homestead exemptions are becoming less valuable, or because states have enacted policies to narrow the effective tax rate differential between homesteads and apartment properties. Figure 2 provides information on how this ratio has changed since 1998.

Figure 2: Apartment-Homestead Classification Ratio, Urban Cities, 1998-2014

Note: see page 9 for definition of "classified" locations.
Lower classification ratios mean that homeowners pay a larger share of the overall property tax burden. Nationally, greater homeowner sensitivity to property tax prices appears to play a role in retarding overall property tax growth. Thirteen of the locations in our Urban set of cities have had classification ratios of no more than 1.05 in at least $75 \%$ (nine of twelve) of the studies we published between payable 1998 and payable 2012. In two of those locations - Los Angeles, California and Portland, Oregon - assessment limitations have been in effect during this period which have offered substantial tax relief to homeowners but which this study did not quantify before payable 2012. However, the eleven remaining locations ${ }^{7}$ have consistently offered little or no preferential treatment to homeowners. Census data indicates that property tax increases between 1998 and 2012, on both a per capita and per $\$ 1,000$ of income basis, have been lower in the nine states these locations represent that have offered little or no homeowner subsidy (Table 21).

Table 21: Property Tax Collections, FY 1998 and FY 2012, for States With No Homeowner-Specific Assessment Limitations and with Classification Ratios $<\mathbf{1 . 0 5}$ and Remaining States

| Fiscal Year | States with no homeowner-specific assessment limitation provisions and Classification Ratio < $1.050(\mathrm{n}=11)$ |  | Remaining States ( $\mathrm{n}=40$ ) |  |

## VII. Appendix: Methodology and Assumptions

This study updates the 50-State Property Tax Comparison Study: Payable Year 2013. It examines four distinct classes of property using a standard set of assumptions about their "true" market values and the split between real and personal property. The tax was calculated for variously-valued parcels in three sets of cities:

- the largest urban area of each state and the District of Columbia along with Aurora, Illinois and Buffalo, New York;
- the largest fifty cities in the United States; and
- a rural area in each state.

More specific details about key assumptions are provided in the sections below.

## Data Collection

Data for property tax calculations was collected in one of two ways. Where possible, we collect property tax data directly from various state and local websites. Where information is not available through this media, we collect data using a contact-verification approach in which we ask state and local tax experts to provide information. In both cases, this information served as the basis for calculations by the Minnesota Center for Fiscal Excellence. Those calculations were, in turn, subject to local verification when necessary.

## Selection of Additional Urban Cities

In Cook County (Chicago) and in New York City, the property tax system (notably, the assessment ratios) is substantially different than the system used in the remainder of Illinois and New York, respectively. We include the second-largest cities in those states (Buffalo and Aurora) to represent the property tax structures in the remainder of those states. In essence, our Urban analysis is a comparison of 53 different property tax structures.

## Selection of Rural Cities

Prior to payable 2008, our methodology for selecting rural cities for this study was to rely on the expertise of local contacts to provide a rural city with a population of between 2,500 and 10,000 with an "average rural tax rate" for inclusion in the study. Unfortunately, in some instances our local contacts provided cities that did not meet these criteria. We modified our methodology for rural city selection by choosing rural cities based on the rural-urban continuum codes developed by the U.S. Department of Agriculture. This provides measurable eligibility criteria, removes subjectivity in city choice, and creates a more heterogeneous set of cities with regard to population and geographic relationship to urban areas.

In most instances, the cities selected for inclusion are county seats in counties coded " 6 " (a nonmetro county with an urban population of 2,500 to 19,999 , adjacent to a metro area) or " 7 " (a nonmetro county with an urban population of 2.500 to 19,999 , not adjacent to a metro area). In five states (Connecticut, Delaware, Hawaii, New Jersey, and Rhode Island), there were no counties coded 6 or 7 . In the case of Massachusetts, the only code 6 or 7 county included Nantucket Island, which we did not select since it does not seem comparable to rural counties in other states. In those cases, we selected the county seat in the most rural county available. Wherever possible, we also included only cities with a population of 2,500 to 10,000 .

## Data on Median-Valued Homes

This study compares homeowner property taxes in Urban and Top 50 cities using a "median value analaysis", which sets the home value in each city equal to the median value of owneroccupied housing units in the city, or for smaller cities, in the relevant county. This data comes from the one-year data in the Census Bureau's American Community Survey for 2013. We intend
this comparison to show how differences in local real estate markets affect residential property taxes.

Note that this is a change from previous editions of the study, where our median home value data came from metropolitan-area data provided by the National Association of Realtors. Readers should make time-trend comparisons of tax burdens on median-valued homes before and after this methodological change with care.

## Components of the Property Tax Calculation

As an aid in reviewing the remaining assumptions of this study, it is helpful to think of the property tax calculation as having five distinct components: (1) a "true" market value (TMV), (2) a local sales ratio (SR), (3) a statutory classification system (classification rate) or other provisions that effectively determine the proportion of the assessor's estimated market value that is taxable (CR), (4) the total local property tax rate (TR), and (5) applicable property tax credits (C). Accordingly, the net local property tax for a given parcel of property is written:

## Net Property Tax $=$ TMV x SR x CR x TR - C

Assumptions about each component are discussed in the sections below.

## True Market Value (TMV)

It is important to note that the calculations for this study start with an assumption about the true market value of the four classes of property. This is the market value of a parcel of property as determined in the local real estate market consisting of arm-length transactions between willing buyers and sellers. This is in contrast to "assessed value" or "estimated market value," which, in most states is the starting point for the tax calculation.

This study assumes the true market value of each property type is the same for each state. For example, the ranking of property taxes on a residential homestead parcel with a true market value of $\$ 150,000$ assumes that the parcel is actually worth $\$ 150,000$ in the local real estate market in each location in each state, regardless of what the local assessor may think the property is worth.

In the cases of some locations the assumed true market value may be very atypical (a $\$ 150,000$ home in Boston, for example). Nevertheless, this study assumes the property exists there. Essentially the goal of this study is to compare the effects of property tax structures. By fixing values we are able to observe the isolated effects of tax structures. That is, we are comparing property taxes, not local real estate markets. However, we do include tables that show the residential tax burdens in our Urban and Top 50 sets of cities where the home value in each location is set equal to the median values of owner-occupied housing units in the metropolitan area for each city, or for smaller cities, for the county in which the city is located. (One-year data in the Census Bureau's American Community Survey for 2013.)

The specific market value assumed for each class of property in this report is described below in the section on property classes.

## Sales Ratios (SR)

A unique aspect of this study is the inclusion of the effects of assessment practices on relative tax burdens across the country. It would have been much simpler to start the calculations by fixing the assessor's "estimated market value" for each property. This would have resulted in a comparison of only the statutory property tax structure. However, in every state, the quality of property tax assessments is a significant aspect of the local property tax scene. Omission of this aspect of the property tax calculation would have made this study much less useful.

Sales ratios are simply a measure of the accuracy of assessments. The sales ratio is determined by comparing assessments to actual sales. If a sales ratio is: above $100 \%$, the property has sold for more than its assessed value, below $100 \%$, the property has sold for less than its assessed value, is $100 \%$, assessments and market values are equal. If the sales ratios are at $100 \%$ that generally indicates that reassessments have just occurred. In some states, sales ratios are used to
adjust assessor's values for use in state aid formulas that use local property wealth as a measure of local fiscal capacity. Sales ratios are generally not used in calculating an individual's actual property tax bill; however, some states use an equalization factor for calculating property tax bills, a factor that equalizes assessment values to market values.

In order for the tax liabilities to represent the actual experience of property owners, and to compare "effective" property tax rates across the states, it is important to use the true market value as a point of reference.

We attempt to adjust the assumed true market value of our sample properties with the use of sales ratios applicable to the location and type of property being studied. These are normally countylevel sales ratios for the specific classes of property. Where location and class specific ratios were not available, we tried to use the ratio most applicable to the property (either a statewide ratio for the class, or in some cases, a county ratio applicable to all property classes).

By applying sales ratios, this study recognizes that our $\$ 150,000$ residential homestead may be "on the books" at $\$ 155,000$ in one location, and $\$ 140,000$ in another, and that the actual tax on the property will be based on these "estimates" of market value. In this study, if the relevant sales ratio in a given location is $93 \%$, we convert the $\$ 150,000$ true market value to $\$ 139,500$ ( $\$ 150,000 \times .93$ ) before applying the provisions of the local property tax.

It is important that we use sales ratios in this study because our fixed reference point for all calculations is an assumed true market value.

In the case of personal property, sales ratios are generally not used. Many states do not have sales ratios for personal property or assume they are $100 \%$. Where states report personal property sales ratios, we include them in this study.

## Classification Rates (CR)

The third component of the property tax calculation involves subjecting the assessor's estimated market value to provisions designed to affect the distribution of property tax levies, namely statutory classification or differential assessment schemes.

In the absence of classification or differential assessments, the distribution of property tax burdens by class of property will reflect the distribution of the assessor's estimated market values, assuming the properties are located in the same set of taxing jurisdictions. That is, a home assessed at $\$ 100,000$ and a business with the same assessment would pay identical property taxes and their effective tax rates (tax as a percent of assessed value) would be the same.

In most states, classification schemes are set by state legislatures. In a few states classification is partly determined by local governments.

Because of the wide variation in the quality of assessments across the states, particularly across classes of property, many states that appear to have no classification scheme may in fact have significant classification via uneven assessments across classes of property, in some cases, perhaps, in violation of state constitution uniformity provision. Some states, like Minnesota, enforces strict standards of assessment quality (sales ratio studies, state orders adjusting values, state certification of assessors, etc.) and put their classification policy in statute.

## Total Local Tax Rate (TR)

Tax rates requested were state and local, payable 2014 applicable to the greatest number of parcels in the largest urban area of each state. "Payable 2014 tax rate" was defined as the tax rate used to calculate the property taxes with a lien date originating in 2014, regardless of the date(s) on which payments are due. In any one city, there may be many different taxing jurisdictions, essentially intersections of city, county, school district, and special taxing district. We asked for the local tax rates for the intersection with the largest number of properties.
We were careful to include the tax rate for all taxing jurisdictions that "normally" levy against real and personal property (namely, cities, counties, school districts, and special taxing districts).

We exclude special assessments from this study since they are more in the nature of user charges, do not affect a majority of parcels, and are usually not sources of general revenue.

## Credits (C)

The final step in the tax calculation is to recognize any general deductions from the gross property tax calculations (credits). Certain states provide credits based on early payment; we assume in the study that taxpayers take advantage of the credit by making the early payment. Any other credits that apply to a majority of parcels of the specified type were included in our calculations.

## Property Classes and True Market Values

The four hypothetical properties studied in this report are (1) residential homesteads, (2) commercial property, (3) industrial property, and (4) apartments.

We selected these classes of property to provide information about certain recurring property tax reform themes in Minnesota, namely the tax on homesteads relative to those on business and apartment property. Other classes of property were omitted either because of their complexity (public utilities, farms), or because the need for information about them was less urgent, at least in Minnesota. The four classes of property studied comprise nearly $70 \%$ of all the market value of real and personal property in Minnesota.

For the homestead property, we assumed two different values of real property, a low value and a high value. Apartment property consists of only one value. This updated study added a third value of $\$ 25$ million for commercial and industrial property. All classes of property contained a corresponding set of assumptions about personal property. While this may seem an unnecessary complication to many readers, note that the Minnesota property tax system includes "tiered" classifications based on value (similar to income tax brackets). In Minnesota, the first $\$ 500,000$ of estimated market value of a residential home is taxed at $80 \%$ the rate applicable to the value over $\$ 500,000$. Business value over $\$ 150,000$ is taxed about 1.4 times more heavily than value under $\$ 150,000$.

Taxes were calculated for the four classes of property in the largest urban area of each state and the District of Columbia, plus the additional cities added when a state's largest urban area has a property tax structure markedly different from the remainder of the state. The following table summarizes the property classes and assumed true market values (and assessed value of personal property) used for each class.

PROPERTY CLASSES AND TRUE MARKET VALUES
Values of Property

| Class | Real | Mach. \& Equip. | Inventories | Fixtures | Total |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Homestead | \$150,000 | \$0 | \$0 | \$0 | \$150,000 |
|  | \$300,000 | \$0 | \$0 | \$0 | \$300,000 |
| Apartments | \$600,000 | \$0 | \$0 | \$30,000 | \$630,000 |
| Commercial | \$100,000 | \$0 | \$0 | \$20,000 | \$120,000 |
|  | \$1,000,000 | \$0 | \$0 | \$200,000 | \$1,200,000 |
|  | \$25,000,000 | \$0 | \$0 | \$5,000,000 | \$30,000,000 |
|  | \$100,000 | \$50,000 | \$40,000 | \$10,000 | \$200,000 |
| (50\% Personal) | \$1,000,000 | \$500,000 | \$400,000 | \$100,000 | \$2,000,000 |
|  | \$25,000,000 | \$12,500,000 | \$10,000,000 | \$2,500,00 | \$50,000,000 |
| Industrial (60\% Personal) | \$100,000 | \$75,000 | \$60,000 | \$15,000 | \$250,000 |
|  | \$1,000,000 | \$750,000 | \$600,000 | \$150,000 | \$2,500,000 |
|  | \$25,000,000 | \$18,750,000 | \$15,000,000 | \$3,750,000 | \$62,500,000 |

## Real and Personal Property

The treatment of personal property is a significant part of the property tax in every state. To get an appropriate ranking of the property taxes on all classes of property, and particularly personal property, it is important to make specific assumptions about the amount of personal property
associated with each example. In the body of this report, we present industrial rankings based on a $50 \%-50 \%$ and $40 \%-60 \%$ mix of real and personal property value, respectively.

The specific mix of real and personal property obviously varies by industry and location. Since some states tax most personal property and other states exempt exempt some or all personal property, the tax rankings, particularly for industrial parcels, are sensitive to the assumed mix of values.

This study does not include intabgibles such as bank balances or financial securities in the property tax calculations.
We define the types of property as follows:

## Real Property

Property consisting of land and buildings not classified as personal property for tax purposes.

## Personal Property - Machinery and Equipment

This includes large and ponderous equipment, generally not portable and often mounted on special foundations. It would include such items as large printing presses and assembly robots.

## Personal Property - Inventories

This includes raw materials, unfinished products, supplies and similar items.

## Personal Property - Fixtures

Fixtures include such items as office furnishings, display racks, tools and similar items, but not motor vehicles. In the case of apartments, it would include such things as stoves, refrigerators, garbage disposals, air conditioners, drapes, and lawn care equipment.

## Property Classes and True Market Values

With the permission of the Minnesota Department of Revenue's Research Division, we have borrowed the methodology they use to determine shares of real and personal business property in their biennial Tax Incidence Study. Using that methodology, we have calculated state-specific real property, machinery and equipment, fixtures, and inventory shares for industrial parcels. The findings this model generate indicate that our assumptions regarding industrial personal property are very reasonable; according to the model, average split for industrial parcels nationwide is $44.0 \%$ land and buildings (real property) and $56.0 \%$ personal property. Overall, the shares of personal property range from $50.7 \%$ (Oregon) to $60.0 \%$ (Montana) with corresponding shares of real property value.

In some previous editions of this study we measured tax burdens and rankings for industrial parcels where we allowed the shares of personal property to vary from state to state. We discontinued this analysis beginning with our payable 2011 report to focus resources on other study-related initiatives.

## Effective Tax Rates (ETRs)

Repeated reference has already been made to the concept of effective tax rates. In contrast to statutory tax rates that apply to taxable values, in this study effective tax rates are used to express the relationship between net property taxes and the true market value of the property. By including the effects of all statutory tax provisions as well as the effects of local assessment practices, effective tax rates have the virtue of allowing more meaningful comparisons across states and property types.

The comparison tables included in this report show actual dollar taxes and effective tax rates ranked from highest to lowest as well as alphabetically.

## Estimates of Assessment Limitation Effects

Beginning with our report for taxes payable 2012, we estimate the effect that provisions that deliver property tax relief for homeowners by limiting increases in home value or property taxes at the parcel level. Generally, the value of parcel-specific assessment limitations results from a combination of the length of homeowner tenure and changes in the market value of the parcel relative to the provisions of the applicable limitation. We use data from the Census Bureau's American Community Survey to estimate that average length of homeowner tenure for locations where assessment limitation provisions are in effect. We use data from the Federal Housing Finance Agency's House Price Index for All Transactions to estimate the average change in residential property value in locations where assessment limitation provisions are in effect. We then model the average change in residential property value over the average length of homeowner tenure in each of these locations and compare that change to the allowable growth in homestead value and/or taxes during that period to determine the amount of excluded value or property tax relief these provisions afford.

One final key assumption: the model represents the experience of a homeowner with an "average" length of tenure. Therefore, if the model returns no excluded value, then we assume that the provision does not apply to half or more of homeowners and therefore does not apply.
We prepared a working paper for the Lincoln Institute of Land Policy on this subject where there is considerably more detailed information on the methodology underlying this analysis. It is available at: https://www.lincolninst.edu/pubs/2033_Property-Assessment-Limits--Effects-on-Homestead-Property-Tax-Burdens-and-National-Property-Tax-Rankings- .

## Special Property Tax Provisions

This study excludes all "special property tax provisions." These are defined as provisions that, in practice, apply to less than half of all taxpayers for a given class of property. Special provisions are normally triggered by special circumstances or attributes of the taxpayer or property. Examples include senior tax deferrals, and special valuation exclusions based on age, health or special use.

The goal of this study is to compare the actual tax experience of the largest number of taxpayers in the selected jurisdictions.

## What Do Rankings Mean?

Property tax rankings must be evaluated in the broader context of each state's fiscal system. The level of property taxes in each state reflects the level of local spending there, intergovernmental aids paid to local governments, the relative use of non-property tax sources of financing public services such as local income or sales taxes and fees, for selected classes of property, state and local policies that affect the distribution of the property tax burden across properties.
